

Zelmic AB

Zelmic is a pharmaceutical contract research organisation with the ability to take a project from start to clinical testing including product transfer to a commercial manufacturing site. We are focused on topical delivery and on local delivery of proteins/peptides.

Zelmic has long experience of running pharmaceutical projects and we offer our services either as responsible for the pharmaceutical part of the project or as responsible for the success of the entire project. Zelmic also offer valuation of projects and generation of project plans for investment decisions.

Zelmic has developed several patented new technologies for topical and local delivery of drugs with the objective of solving problems regarding delivery and stability.

We do analytical development in the form of development of assay methods for actives and excipients including recombinant proteins well as development and validation of stability indicating methods.

The development work includes stability screening and studies of the delivery in the form of studies on penetration of the drugs through skin, nails and artificial membranes

Zelmic AB

Just a moment

If you feel that Zelmic may be of assistance to you, don't hesitate to contact us for a proposal. We are a small and flexible organization and our main success criterion is to meet the requirements of our clients with respect to timelines, costs and quality standards.

We offer the following specific services:

Analytical chemistry	Assay method development including verification/validation Method transfer to GMP units Development of stability indicating methods Generation of documentation for CTX/NDA
Formulation	Solving stability or penetration issues by novel formulations/ technologies Investigations on formulation IP Formulation of new compounds in standard formulations Product/project transfer to commercial manufacturer(s)
Penetration	"in vitro" pig or human skin Franz or Bronaugh cell investigations Split skin or artificial membrane testing Human nail or bovine hoof membrane testing Studies with radio-labelled compounds
Stability studies	Stability screening Investigation on degradation pattern Transfer to commercial manufacturers
Project	Project management Evaluation of projects Generation of project plans to estimate of cost and time
IP infringement)	Investigation on formulation IP (patentability and potential
